

RaceDay application

What is it?

- The RaceDay application is a web-based event management system designed to make it easier for people to organise and participate in running, walking and cycling events.
- The application is developed using ASP.NET Core MVC and communicates with a RESTful Web API built in Part 2

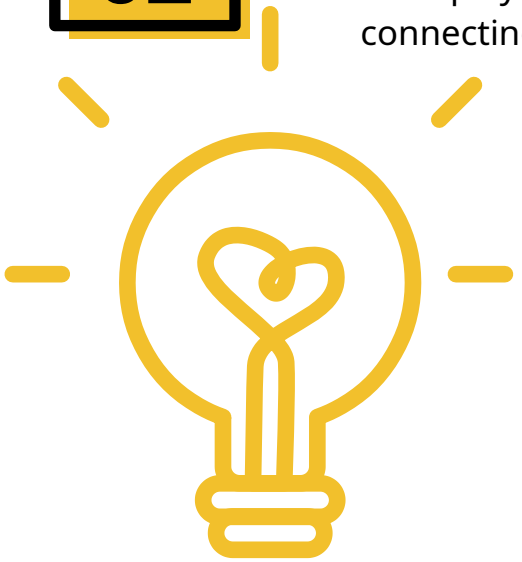

01

- The API handles the main operations and communicates with the SQL Server database, where information such as user accounts, events, categories, enrolments and race results is stored.

02

- This structure allows the MVC application to display information to users without connecting directly to the database.

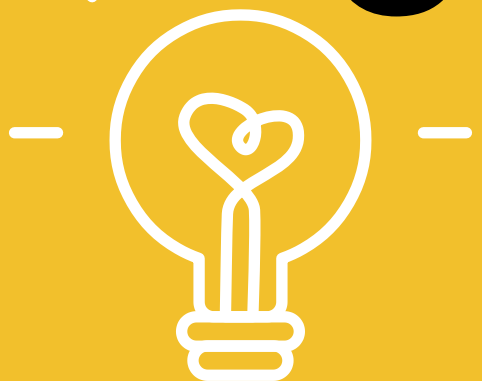

03

- The application also uses Bootstrap and CSS to provide a modern, responsive and user-friendly interface that can be accessed on different devices.

04

01

When a user visits RaceDay, they can register for an account or log in using their email address and password. During registration, users select whether they want to join as an Organiser or a Participant. The application uses session-based authentication to maintain the user's login status and role while they navigate through the website. Organisers have access to a dashboard where they can create, update and delete sporting events, manage event categories, view participant enrolments and record finishing times and positions. Participants can browse upcoming events, view event details, select suitable categories and enrol in events. They can also manage their personal profiles and view their previous race results, allowing them to keep track of their sporting progress.

About

- RaceDay also includes additional features that improve the overall management and performance of the platform.
- Azure Blob Storage is integrated through the API to allow users to upload and store event banner images and participant profile pictures without the MVC application communicating directly with Azure.
- Docker is used to containerise the MVC application so that it can run in a consistent environment across different computers and systems.

Conclusion

- The application uses role-specific navigation, input validation and clear status indicators to make the website easier and safer to use. Overall, RaceDay brings organisers and participants together on one platform, making sporting event management, registration and result tracking more convenient, organised and accessible.
